

Om Panjwani

Frontend Developer | React | TypeScript | JavaScript

+91 8770228448 | ompanjwani77@gmail.com | linkedin.com/in/ompanjwani | github.com/panjwaniom | ompanjwani.vercel.app

Frontend Developer specializing in React and TypeScript, with three shipped projects spanning full-stack development, REST API integration, and UI performance optimization. Skilled in component architecture, state management, and type-safe API integration. Focused on writing clean, maintainable code that delivers consistent user experiences across devices.

SKILLS

Languages: JavaScript (ES6+), TypeScript, Java, Python

Frontend: React, HTML5, CSS3, Tailwind CSS, Bootstrap, REST APIs, Responsive Design, Component Architecture

Tools: Git / GitHub, Chrome DevTools

Backend: Node.js, Express.js, MySQL

PROJECTS

Personal Developer Portfolio | Dec 2025 – Feb 2026

React, Javascript, CSS3 | ompanjwani.vercel.app

- Designed a macOS-inspired desktop interface in React with draggable windows, z-index layering, traffic-light controls, and a functional dock, implementing all interactions from scratch using React state and native DOM APIs.
- Built an interactive dock with **5 functional app windows** (About, Skills, Projects, Contact, and Resume), each opening independently with its own isolated state.
- Optimized rendering across an animation-heavy layout by eliminating render-blocking resources, achieving a **0.6s** First Contentful Paint and zero Total Blocking Time on desktop.
- Achieved a **Lighthouse performance score of 100** on desktop across a visually complex, animation-heavy interface with no third-party UI libraries.

Task Manager Web App | Mar 2025 – Jun 2025

React, Node.js, MySQL, Express.js | github.com/panjwaniom/task-todo-web-app

- Developed a full-stack task management system with **JWT**-based authentication, protected routes, and persistent session handling across React and a Node.js/Express backend.
- Designed a relational **MySQL** schema for task-user mapping connected to a structured REST API with consistent error responses.
- Structured the frontend into reusable React components, separating concerns across **authentication, task CRUD, and UI feedback layers** for easier maintenance and scaling.
- Reduced redundant API calls using **HTTP 304 caching**, cutting unnecessary network requests on repeat interactions across core task operations.

Weather & News Dashboard | Dec 2024 – Feb 2025

React, TypeScript, REST APIs | github.com/panjwaniom/weather-news-dashboard

- Consumed OpenWeatherMap and NewsAPI in React and TypeScript, delivering live weather forecasts and categorized news feeds across a fully typed component and data layer.
- Handled invalid city inputs with a dedicated error state displaying a "City Not Found" message, and implemented a **4-category news filter** (General, Tech, Sports, Business) with clickable tab switching.
- Reduced API calls from **6-8** per search to **2-3** by implementing a 300ms debounced input handler, alongside typed error boundaries and granular loading states.
- Enforced full type safety across all API responses and component props using TypeScript interfaces, eliminating runtime type errors during development.

EDUCATION

Bachelor of Computer Applications (BCA)

Maharaja Agrasen Himalayan Garhwal University | 2021–2024
